(http://expasy.hcuge.ch/sprot/prosite.html) and Pfam (http://fam.wasil.edu/) libraries. A description of these categories can be found at the function of each repeat as either transposon, putative microsatellite, LINE, direct repeat, centromeric repeat, etc.
                                                                                                                                                                                                                                                                                          If you have any questions or confirmatory or contradictory evidence concerning the annotation of F9H3, please direct email to Larry Darnell at parnell@cshl.org.

BAC F9H3 was sequenced as part of the arabidopsis genome sequencing effort of the Cold Spring Harbor Consortium. For additional information, please see http://www.cshl.org/arabweb. Fingerprint data indicate F9H3 overlaps with F4C21 toward the telomere and with T5L23 toward the centromere. F9H3 contains marker mi233 at 18.8 cM on the Lister & Dean RI map.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    / peruno

Arabidopsis thalian

Arabidopsis thalian

Arabidopsis thalian

BAC F9H3 is assigned between YACS CIC4A7 and CIC6B1 and maps to
near 18 a C won the Lister & Dean RI map. Position 105 F9H3 is
oriented toward the centromere and position 95519 is oriented
toward the telomere. For more information on the mapping,
sequencing and annotation of F9H3, please see
http://www.cshl.org/arabwab/F9H3-titlepage.html. A graphic view of
our annotation is also available at this url. Gene models are built
with exons predicted by GenScan
(http://cCR-081.mit.edu/GENSCAN.html), MZEF
(http://ccmpio.orml.gov/tools/index.shtml) and with splice sites
predicted by NetPlantGene
(http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html). Alternate exons
not used in building the gene models are presented on the scheme
associated with F9H3. Genes are numbered according to the scheme
BAC.gene number. Typically, these numbered according to the scheme
some moves from position 1 of the BAC. Protein sequences ecoded
by the genes are assigned to a functional category with the aid of
similarity searches and comparison to the Prosite

Coding seqences below are the result of integration and manual review of the following data: computer analysis using the program Genefindar (P. Green and L. Hilller, personal communication), the large scale EST projects of Yuji Kohara (http://www.ddbj.nig.ac.jp/c-elegans/html/CE INDEX.html) and The C. elegans/Reproject (http://worfdb.dfci.harvard.edu/), similarity to other proteins from BlastX analyses (http://blast.wastl.edu/), sequence conservation with C. briggsae using Jim Kent's WABA alignment program (Genome Research 10:115-1125, 2000), individual C. elegans GenBank submissions, and personal communications with C. elegans GenBank submissions, are predicted using the program tRNAscan-SE (Lowe, T.M. and Eddy, S.R., 1997, Mull. Acids. Res., 25, 955-964).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /codon_start=1

```

```
it may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.
```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one ml3 subclone.

## NEIGHBORING CLONE INFORMATION

The 5' clone is ZC178, 200 bp overlap; the 3' clone is B0507, 200 bp overlap. Actual start of this clone is at base position 1 of ZC196; actual end is at 3481 of B0507.

## NOTES:

Coding seqences below are the result of integration and manual review of the following data: computer analysis using the program Genefinder (P. Green and L. Hillier, personal communication), the large scale EST projects of Yuji Kohara (http://www.ddbj.nig.ac.jp/c-elegans/html/CE INDEX.html) and The C. elegans ORFeome cloning project (http://worfdb.ddci.harvard.edu/), similarity to other proteins from BlastX analyses (http://blast.wustl.edu/), sequence conservation with C. briggsae using Jim Kent's WABA alignment program (Genome Research 10:1115-1122, 2000), individual C. elegans Genbank submissions, and personal communications with C. elegans Genbank submissions, and personal communications with C. elegans researchers. tRNAs are predicted using the program tRNAscan-SE (Lowe, T.M. and Eddy, S.R., 1997, Nucl. Acids. Res., 25, 955-964).

ON Apr 19, 2003 this sequence version replaced gi:10944443.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by Migh quality data (i.e., pired quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly Location/Qualifiers

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Computational Analysis of Pull-Length Mouse cDNAs Compared
Normalization and subtraction of Cap-trapper-selected cDNAs to
prepare full-length cDNA libraries for rapid discovery of new
genes. Genome Res. 10 (10), 1617-1630 (2000)
RIKEN integrated sequence analysis (RISA) system--384-format
sequencing pipeline with 384 multicapillary sequencer. Genome Res. Computer based methods for the mouse full-length cDNA computer. Dased methods for the mouse clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (201) CDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to /tissue_type="ammion" /dev_arage="17 days pregnant adult" /clone_lib="RIKEN full-length enriched, 17 days pregnant adult_female ammion" prepare mouse fissues. /gocattatgaco; site_2: Sfil (gocactaggco;); cDNA made
by oligo-dT priming and directionally cloned. 5' and 3'
adaptors were used in cloning as follows:
5'-AAGAGTGGATCAACGAGTGGCCATACGGCGGG-3' and
5'-ATTCTAGAGGCGCGCGCGCAATG-dT(30)NN-3'. Full-length
enriched library was constructed using the Clontech
Creator SMART kit and size-selected to contain the 0.2-0.5
kb size fraction (other fractions present in NIH MGC 143)
Library created in the laboratory of M. Brownstein (NIMH,
NIH). Note: this is a NIH_MGC Library."

Sequence 21, Application US/09479123

Patent No. 6670185

GENERAL INFORMATION:
APPLICANT: HARRINGTON, JOHN J.
APPLICANT: SHERE, BRUCE
APPLICANT: RINDET, STEPHEN
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR NON-TARGETED ACTIVATION OF
TITLE OF INVENTION: ENDOGENOUS GENES
TITLE OF INVENTION: 0003B
CURRENT APPLICATION NUMBER: 09/23, 814
PRIOR FILING DATE: 1999-03-08
PRIOR FILING DATE: 1999-02-19
PRIOR FILING DATE: 1999-02-19
PRIOR FILING DATE: 1999-02-19
PRIOR PELING DATE: 1998-09-24
PRIOR FILING DATE: 1998-09-24
PRIOR FILING DATE: 1997-09-26
SOFTWARE PRIOR NUMBER: 09/159, 643
PRIOR FILING DATE: 1997-09-26
NUMBER OF SEQ ID NOS: 33

The invention relates to a novel nucleic acid for a virus vector with silencer-blocking insulator activity that integrates into the genome of a mammalian stem cell comprising an insulator element a viral regulatory control element, and a coding nucleic acid molecule operatively associated with the viral regulatory element and capable of expression in the cell. The insulator element comprises a gypsy sequence, a cH84 dimer comprises an infectious retrovirus vector sequence or a lentivirus vector sequence. The infectious retrovirus sequence or a lentivirus vector sequence of 6143 bp, given in the specification. The coding nucleic acid molecule is a reporter gene, where the reporter gene is PGK edger. The host cell is a stem cell of embryonic or adult tissue origin. The nucleic acid of the invention has antianaemic, antisickling, cytostatic, antiparkinsonian, nootropic, and nucleic acid is useful for stem cell marking or stem cell genetic manipulation studies. The nucleic acid or vectors and compositions comprofications are sequenced acid is useful for stem cell marking or stem cell genetic comprising if are also useful in stem cell marking or stem cell genetic comprising if are also useful in stem cell genetic acid or vectors and compositions comprising it are also useful in stem cell marking or stem cell states of stem cells, e.g. thalassaemia, sickle cell anaemia, leukaemia, malignancies, or multiple colles und a parkinson's disease, and as parkinson's disease, and a parkinson's di

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleotide construct for generating DNA constructs. The nucleotide construct comprises a sequence encoding a positive selection marker flanked by restriction enzyme sites, where restriction site is flanked by sequences which are not complementary to each other and which do not include at least one type of base at any position, where the construct can be treated so that single-stranded regions are created at each sequence lacking at least one nucleotide. The nucleotide construct is useful in a rapid and efficient method for generating DNA constructs suitable for introduction into embryonic stem cells and for disrupting the function of a gene in a cell. The present sequence is plasmid pGG4 vector construct containing an ampicillin resistance gene, a neowycin gene (Neo') and a green fluorescent protein (GFP) gene. On each site of the Neo' gene are two sites for ligation independent cloning along with restriction sites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            27 CCCGGCATTCTCGCAAGCTTCAAAAGCGCACGTCTGCCGCGCTATTGTGAGCGCTCACAA 86

The invention relates to a novel isolated polynucleotide comprising a dendritic cell (DC)-expressed S-adenosyl homocysteine hydrolase (AHCY)-like molecule (DCL) gene. The polynucleotide of the invention demonstrates antiallargic and immunosuppressive activities and may be useful for treating a condition including an allergy such as asthma, allergic rhinitis or systemic anaphylaxis, an autoimmune disease such as diabetes mellitus or rheumatoid arthritis or transplant rejection. Furthermore, the polynucleotide may be useful as a vaccine or during gene therapy procedures. The genetically modified animal or the identified modulatory agent of the invention may be used in the study of immunity, DC function, brain physiology or neuronal cell function. The current sequence is that of the mouse DCAL knockout targeting vector DNA of the

The present invention relates to a new nucleotide construct comprising a sequence encoding positive selection marker flanked by sequences which are sites. The restriction enzyme sites. The restriction enzyme sites are flanked by sequences which are not complementary to each other and which do not include at least one type of base at any position, where the construct is treated so that single-stranded regions are created at each sequences lacking at least one care and sequences of the invention is useful for disrupting the function of a carget sequence or gene in a cell e.g. embryonic stem cell, by inserting sequences homologous to the target gene into the construct such that the sequences homologous to the target gene into the construct such that the capturet into the cell to produce a homologous recombinant and thus the construct into the cell to produce a homologous recombinant and thus the function of the target gene is disrupted. The homologous construct, and introducing the targeting construct into the cell to produce a homologous recombinant and thus the bedistructed. The invention eliminates the site in the target gene that is to be disrupted. The invention eliminates the need for the traditional solation of a single genomic clone, restriction mapping of the clone and multiple cloning steps. The method of the invention is fast and efficiently generates nucleotide construct, and reduces the time of required for mapping the restriction sites within the clone is not needed for the method. The method is ligation independent cloning the produce of the method of the constructs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nucleic acid sequence represents the PDG4 plasmid vector sequence of the

The invention relates to a targeting construct comprising two sequences homologous to a target gene, and a selectable marker, is new. The target benedicted to a target gene, and a selectable marker, is new. The target gene is a retina-specific muclear receptor gene, a lymphoid-specific GPCR (G protein coupled receptor) gene, a medianocyte stimulating homomome, chemokine receptor gene, a cGMP phosphodiesterase gene, chemokine creceptor like protein gene, a cGMP phosphodiesterase gene, chemokine creceptor like protein gene, where the mouse exhibits an eye abnormality, cilluration, hypoactive behaviour, lung abnormality, elluration, hypoactive behaviour, lung abnormality, incellular infiltration, hypoactive behaviour, lung abnormality, liver, lymph collust infiltration, hypoactive behaviour, lung abnormality, or elevated levels of AlT (not defined), phosphorus, potassium, or clavated levels of AlT (not defined), phosphorus, potassium, or clavated levels of AlT (not defined), phosphorus, potassium, or clavatety behaviour. The construct is used for introducing targeted cused as models for diseases or conditions associated with physiological, used as models for diseases or conditions associated with physiological, trarget gene (e.g. tumours, cancer, retinal degeneration and retinitis consenting or traating diseases. The present sequence is the vector popd used to generate the gene targetting compounds capable of the popd used to generate the gene targetting construct of the invention.

The present sequence for plasmid vector pDG4 is used as a construct for genes encoding trinucleotide repeat proteins (TRP) such as gene T243 to produce disruption in the DNA. The invention describes methods of producing embryonic stem (ES) cells comprising a heteroxygous disruption in a target DNA sequence (preferably T243) encoding a TRP and of producing a knockout mouse comprising a hemoxygous disruption in a target DNA sequence (preferably T243) encoding a TRP and of concoding TRP, where the disruption inhibits the production of the wild type TRP. The invention also relates to identifying agents capable of affecting a phenotype of a knockout mouse. Also described are methods of determining whether expansion of the trinucleotide repeat in a gene encoding TRP produces a phenotypic change. The transgenic animals and the colling are useful for identifying compounds capable of ameliorating disease symptoms, and as test substrates for the identification of drugs, pharmaceuticals, therapies and interventions which may be effective in the Huntington's disease. The animal models for trinucleotide repeat disorders e.g. fragile X syndrome and Huntington's disease. The animal models for trinucleotide repeat in vivo, the molecular basis of these diseases observed in human disease. Using the mice, it is possible to model both the pathogenic mechanism and the trinucleotide repeat instability in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   27 CCCGGCATTCTCGCAAGCTTCAAAAGCGCACGTCTGCCGCGCTATTGTGAGCGCTCACAA 86

The present sequence represents vector pDG4. This vector contains an ampicillin resistance gene, a neomycin gene and a green fluorescent protein (GFP) gene. The vector is used in the invention. The specification describes a non-human transgenic animal comprising a disruption in the matrix metalloproteinase (MMP) 23 gene. Transgenic animals of the invention comprising a homozygous or heterozygous or manals of the representation and also an animal are capable of ameliorating a phenotype of a transgenic animal comprising a disruption in an MMP-23 gene or ameliorating a disease associated with the phenotype of a transgenic animal model for diseases, disorders and conditions characterized by a disruption in gene encoding a metalloproteinase, more particularly disease, disorders and conditions associated with the phenotypes demonstrated by the knockout mice. The transgenic animals are useful as test substrates for identification of drugs, pharmaceuticals and therapies effective in the target gene. The animals are useful as test substrates for treatments relating to behavioural phenotypes demonstrated by the animal conditions associated with the phenotypes demonstrated by the animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            4625 cedescarrencecaecerreaaagescaecererececececererrecererrecentar 4684

                                                                                                                                                                                                                                                               The invention relates to nucleotide construct for generating DNA constructs. The nucleotide construct comprises a sequence encoding a positive selection marker flanked by restriction enzyme sites, where restriction site is flanked by sequences which are not complementary to each other and which do not include at least one type of base at any position, where the construct can be treated so that single-stranded regions are created at each sequence lacking at least one nucleotide. The nucleotide construct is useful in a rapid and efficient method for generating DNA constructs suitable for introduction into embryonic stem sequence is plasmid pDG2 vector construct containing an ampicillin resistance gene and neomycin gene (Neo'). On each site of the Neo' gene are two sites for ligation independent cloning along with restriction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      27 CCCGGCATTCTCGCAAGCTTCAAAAGCGCACGTCTGCCGCGCTATTGTGAGCGCTCACAA 86

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠે
                                                                                                                                                                                                                                                                                                  The invention relates to a targeting construct comprising two sequences homologous to a target gene, and a selectable marker, is new. The target gene, and a selectable marker, is new. The target gene is a retina-specific neceptor gene, a melanocyte stimulating hormone receptor gene, a magnesium-dependent protein phosphatase gene, chemokine receptor 1-like protein gene, a cGMP phosphodiseterase gene, chemokine receptor 1-like protein gene, where the mouse exhibits a gene, compising a disruption in a target gene, where the mouse exhibits an eye abnormality, cellular infiltration, hypoactive behaviour, lung abnormality, elevated white blood cell count, abnormality in the acrta, kidney, liver, lymph nodes, skin or salivary gland, increased body and organ weight, or billrubin, aggressive, hyperactive, increased activity or decreased anxiety behaviour. The construct is used for introducing targeted anxiety behaviour. The construct is used for introducing targeted anxiety behaviour of behavioural phenotypes relating to a disruption in a target gene (e.g. tumours, cancer, retinal degeneration and retinitis pigmentosa) and in screening or identifying compounds capable of ameliorating or treating diseases. The present sequence is the vector post used to generate the gene targetting construct of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3038 cccedelatricicedelacectricalalacecacetriciecececeretriciceretrecenent 3097

The present invention relates to a new nucleotide construct comprising a sequence encoding positive selection marker flanked by restriction enzyme sites. The restriction enzyme sites are flanked by sequences which are not complementary to each other and which do not include at least one type of base at any position, where the construct is treated so that single stranded regions are created at each sequence lacking at least one nucleotide. The invention is useful for disrupting the function of a target sequence or gene in a cell e.g. embryonic stem cell, by inserting sequences homologous to the target gene finto the construct such that the sequences homologous to the target gene finto the positive selection marker, to produce a targeting construct, and introducing the targeting
                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                  3038 cccescarrerescaecerreaaaascscaecererecesceererrerecrererear 3097
disease, disorders and conditions associated with the phenotypes demonstrated by the knockout mice. The transgenic animals are useful as test substrates for identification of drugs, pharmaceuticals and therapies effective in treating diseases, disorders and conditions associated with disruption in the target gene. The animal is useful for testing and developing new treatments relating to behavioural phenotypes demonstrated by the animal models
                                                                                                                                                                                                                                                                            CCCGGCATTCTCGCAAGCTTCAAAAGCGCACGTCTGCCGCGCTATTGTGAGCGCTCACAA 86

construct into the cell to produce a homologous recombinant and thus the function of the target gene or sequence is disrupted. The homologous sequences are sequences flanking the site in the target gene that is to be disrupted. The invention eliminates the need for the traditional hybridisation isolation of a single genomic clone, restriction mapping of the clone and multiple cloning steps. The method of the invention is fast and efficiently generates nuclectide construct, and reduces the time required for making a knock-out vector. Isolating an individual genomic clone or mapping the restriction sites within the clone is not needed for the method. The method is ligation independent cloning. The present nucleic acid sequence represents the PDG2 plasmid vector sequence of the
                                                                                                                                                                                                                                                                                                      ö

o,
a cell with high efficiency and specificity. Use of (I) provides a faster and more efficient means for isolating and selecting cells comprising target gene modification. Also use of (I) provides an increase over previous technologies in both the speed and frequency at which homologous recombination events can be recovered. (I) is also useful for creation of transgenic animals containing targetted gene modifications. This sequence represents a phosphoglycerate Kinase (PGX)-neomycin (neo) gene fragment found in the positive selection vector construct c3406
                                                                                                                                                                                                                                                                                                                                                          75

Novel transgenic animals useful as animal model for characterization of function of a gene encoding trinuclectide repeat proteins (TRPs), contains heterozygous disruption in a gene encoding TRP.

Disclosure, Fig 2B, 106pp, English.

genes encoding trinucleotide repeat proteins (TRP) such as gene 1243 to produce disruption in the DNA. The invention describes methods of producing embryonic stem (BS) cells comprising a heterozygous disruption in a target DNA sequence (preferably T243) encoding a TRP and of producing a knockout mouse comprising a homozygous disruption in a gene encoding TRP, where the disruption inhibite the production of the wild type TRP. The invention also relates to identifying agents capable of affecting a phenotype of a knockout mouse. Also described are methods of determining whether expansion of the trinucleotide repeat in a gene encoding TRP produces a phenotypic change. The transgenic animals and the cells are useful for identifying compounds capable of ameliorating disease symptoms, and as test substrates for the identification of crugs, The present sequence for plasmid vector pDG2 is used as a construct for genes encoding trinucleotion renear noording trinucleotions.

```
invention. The specification describes a non-human transgenic animal invention. The specification describes a non-human transgenic animal comprising a disruption in the matrix metalloproteinase (MMP)-23 gene. Transgenic animals of the invention comprising a homozygous or heterozygous disruption in MMP23 gene are useful for identifying agents which modulate MMP23 expression or function. They are also useful for identifying agents that are capable of ameliorating a phenotype of a transgenic animal comprising a disruption in an MMP-23 gene or animal comprising a disruption in the MMP-23 gene or animal comprising a disruption in the MMP-23 gene or animal anded for diseases, discorders and conditions characterized by a disruption in a gene encoding a metalloproteinase, more particularly
pharmaceuticals, therapies and interventions which may be effective in treating trinucleotide repeat discorders e.g. fragile & syndrome and Huntington's disease. The animal models for trinucleotide repeat discorders are ideal model systems to study the progression of disease in vivo, the molecular basis of these diseases and show the features observed in human disease. Using the mice, it is possible to model both the pathogenic mechanism and the trinucleotide repeat instability in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             86
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pDG2; transgenic animal; matrix metalloproteinase-23 gene; MMP-23 gene;

into the genomes of the cells. (I) is capable of modifying target gene in a cell with high efficiency and specificity. Use of (I) provides a faster and more efficient means for isolating and selecting cells comprising target gene modification. Also use of (I) provides an increase over previous technologies in both the speed and frequency at which homologous recombination events can be recovered. (I) is also useful for creation of transgenic animals containing targetted gene modifications. This sequence represents an oligonucleotide used in the creation of the positive selection vectors for targetted gene modification

ö
cells having targeting vector integrated via homologous recombination into the genomes of the cells. (I) is capable of modifying target gene in a cell with high efficiency and specificity. Use of (I) provides a faster and more efficient means for isolating and selecting cells comprising trarget gene modification. Also use of (I) provides an increase over previous technologies in both the speed and frequency at which homologous recombination events can be recovered. (I) is also useful for creation of transgenic animals containing targetted gene modifications. This sequence represents a partial phosphoglycerate kinase (PGK) promoter incorporated into the positive selection vector constructs described in the invention

rgeting vector modifying target gene, has first and second shomologous to target gene portions, a selectable marker and regulator, useful for producing animals with targeted gene Novel targeting vecto sequences homologous modifications.

Example 1; Fig 8; 43pp; English.

The invention describes a targeting vector (positive selection vector) (1 capable of modifying a target gene, (1) comprises two sequences (SI and S2) homologous to a portion or region of a target gene, a selectable marker cassette and a regulator. (1) is useful for producing cells comprising a modification of the target gene which involves introducing (I) into cells capable of homologous recombination, selecting for cells expressing the selectable marker and identifying cells containing the modification of the target gene. When of target gene comprising disruption or modification of target gene enhances recovery of cells having targeting vector integrated via homologous recombination

```
The invention describes a targeting vector (positive selection vector)

(I) capable of modifying a target gene. (I) comprises two sequences (S1 and S2) homologues to a portion or region of a target gene, a selectable marker cassette and a regulator. (I) is useful for producing cells comprising a modification of the target gene which involves introducing (I) into cells capable of homologous recombination, selecting for cells expressing the selectable marker and identifying cells containing the modification of the target gene. Use of (I) for enriching cells marker and identifying cells containing the comprising disruption or modification of target gene enhances recovery of cells having targeting vector integrated via homologous recombination into the genomes of the cells. (I) is capable of modifying target gene in

Novel targeting vector modifying target gene, has first and second sequences homologous to target gene portions, a selectable marker cassette and regulator, useful for producing animals with targeted gene modifications.

Claim 9; Fig 6D; 43pp; English.

The invention describes a targeting vector (positive selection vector) (I) capable of modifying a target gene. (I) comprises two sequences (SI and S2) homologous to a portion or region of a target gene, a selectable marker cassette and a regulator. (I) is useful for producing cells comprising a modification of the target gene which involves introducing (I) into cells capable of homologous recombination, selecting for cells expressing the selectable marker and identifying cells containing the modification of the target gene. Use of (I) for enriching cells condition or modification of target gene enhances recovery of
